MERCHANT PAYMENTS / BUILT ON NEAR

Get paid. Keep your *keys.*

Checkout, payment links and verified receipts.
One workspace. Straight to your wallet.

NEAR-native Merchant-first Verifiable settlement

THE MERCHANT JOB

A wallet transfer isn’t a complete *sale.*

For a business accepting wallet payments, the work continues after a customer presses Send.

01

Make the request clear

Specify the item, exact amount, asset and payment destination.

02

Know what actually settled

Match the payer to the order and distinguish submission from successful payout.

03

Keep a useful record

Give the customer a receipt and retain payment history for the business.

The opportunity: turn a transfer into a trackable merchant payment.

ONE MERCHANT WORKSPACE

A clear route from customer to your *wallet.*

Start with a payment link. Add checkout. Follow every order through verified settlement.

REQUEST

Create & share

Fixed-amount links with item descriptions, expiry and claim limits.

PAY

Review & approve

A wallet-signed checkout with network, asset and payout details.

RECONCILE

Verify & record

Order states, merchant history and downloadable payment receipts.

Customer wallet → Authorized order → Verified payout → Merchant wallet

PROPOSED BEACHHEAD

Start where a link can close the *sale.*

Focus on NEAR-connected sellers who can begin with a fixed payment request, without a custom storefront integration.

SOCIAL COMMERCE

Independent sellers

Share a product payment link in a message, social post or customer conversation.

SERVICES

Freelancers & studios

Request a deposit or project balance and identify the service on the receipt.

ONLINE STORES

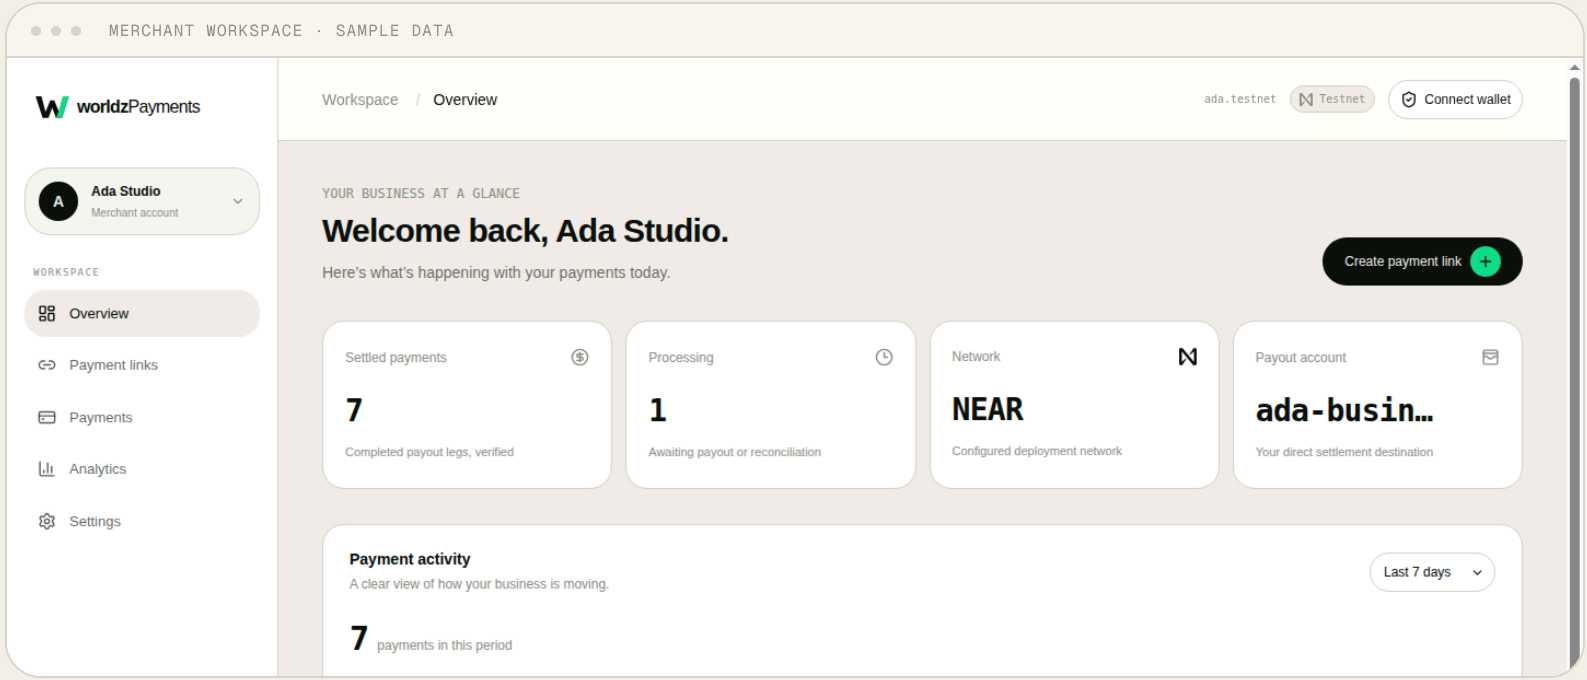

Small web businesses

Use hosted checkout first; adopt a custom integration when needed.

A focused starting segment, not a claim that every merchant already wants crypto checkout.

CURRENT PRODUCT INTERFACE

A business view of every *payment.*

At a glance

Settled and processing activity, with volume kept separate by asset.

From link to ledger

Create requests, search payments and inspect individual orders.

Wallet ownership

Login identity and payout destination are managed separately.

Current interface, captured from the app. Merchant names, balances and payment activity are illustrative sample data.

A COMPLETE CUSTOMER JOURNEY

Request. Approve. *Receipt.*

Give each payment the context a merchant and customer need.

01 **Review the request**

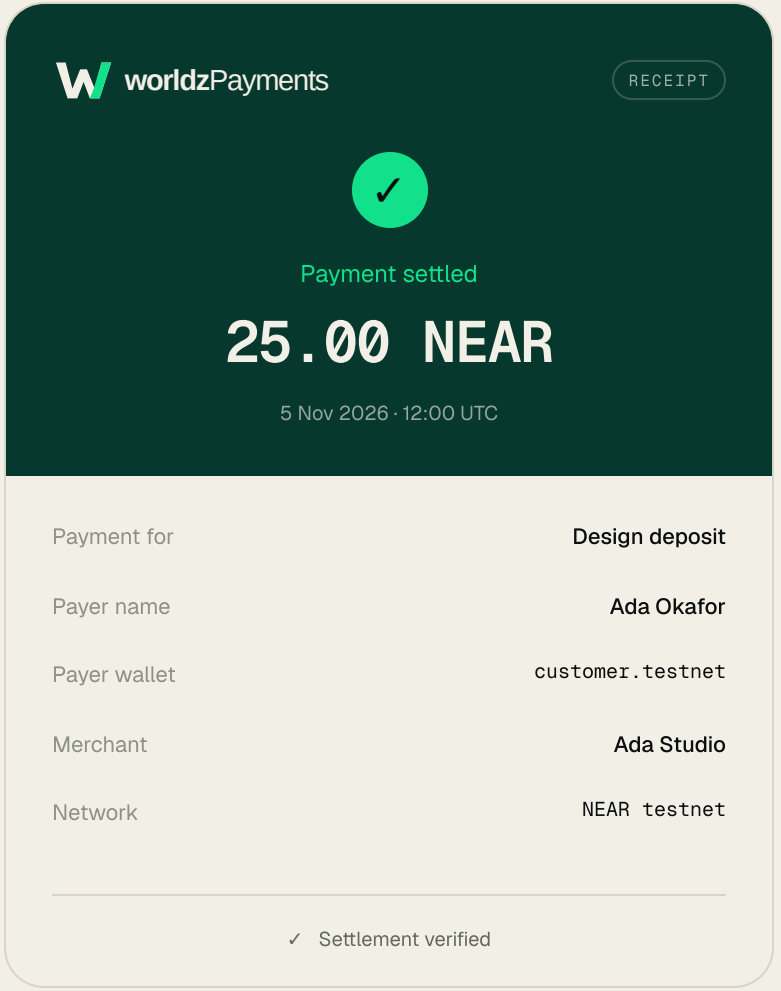

Item or service, amount, network and payout destination.

02 **Pay with a NEAR wallet**

The payer approves the authorized transaction in their wallet.

03 **Keep the proof**

A settled receipt shows what was paid for and the payer details.

Illustrative receipt · sample payment and payer details

VERIFICATION IS THE PRODUCT BOUNDARY

Submitted is not *settled.*

The service verifies successful payout legs before presenting a payment as complete.

01

Payer wallet

Signs a payer-bound order authorization.

→

02

NEAR router

Executes merchant and applicable fee payouts asynchronously.

→

03

Merchant service

Reconciles finalized events and router state.

→

04

Payment settled

Verified settlement receipt issued.

Recovery without another payment

Partial and retryable payout states remain visible for reconciliation.

Proof beyond a browser redirect

Signed webhooks support server-side, idempotent fulfilment.

Order funds can remain in the routing contract while payouts complete. No custody of merchant wallet keys.

A PATH FROM HOSTED TO CUSTOM

Start with a link. Build on the *API.*

A low-friction merchant entry point, with developer tools for a deeper checkout experience.

HOSTED

No-code payment links

Create a fixed request and send customers to a hosted payment page.

SOURCE CLIENT

TypeScript helpers

Use the in-project API, wallet, exact-amount and payment helpers.

INTEGRATION

REST & signed webhooks

Create links, claim orders, read status and verify settlement notifications.

```
POST /api/v1/links  →  /pay/{slug}  →  payment.confirmed
```

Current merchant endpoints use wallet-authenticated session cookies. A public npm SDK and Bearer/API-key authentication are roadmap work, not shipped capabilities.

DEFAULT PLATFORM FEE

A fee tied to payment *activity.*

0.30%

Default platform fee
30 basis points per payment

PROCESSED VOLUME	GROSS PLATFORM FEE
1,000 NEAR	3 NEAR
10,000 NEAR	30 NEAR
100,000 NEAR	300 NEAR

Arithmetic illustrations only; not traction or a forecast. Assumes the default 0.30% rate across all volume. Gas, token storage, operating costs and taxes are excluded. The signed order determines its agreed fee.

THE WORKFLOW ADVANTAGE

More than an address. Less checkout work to *build.*

MERCHANT TASK	RAW WALLET TRANSFER	CUSTOM INTEGRATION	WORLDZPAYMENTS
Request a payment	Share address & amount	Build the request flow	Hosted payment link
Connect payment to order	Manual matching	Build order tracking	Payer-bound order
Confirm settlement	Interpret transaction	Build reconciliation	Verified payout status
Provide a receipt	Create a separate record	Build receipt generation	Display + PDF receipt
Operate the business	Separate records	Build admin tools	Merchant workspace

Workflow positioning, not a benchmark of named providers. The opportunity is an integrated merchant experience on NEAR.

EARN THE FIRST REPEAT MERCHANTS

Make the payment link the *entry point.*

Prove a narrow merchant workflow before expanding channels and integration depth.

01

Recruit design merchants

Start with NEAR-connected sellers, studios and small stores.

02

Assist the first sale

Help configure a payout account and create a clear payment request.

03

Validate repeat use

Watch request-to-settlement friction and merchant reconciliation needs.

04

Expand through builders

Use docs, demos and ecosystem relationships to support integrations.

Merchant shares a link → Customer completes checkout → Merchant reconciles → Repeat sale

IMPLEMENTED PRODUCT / VALIDATION AHEAD

Working surface. Clear launch *gates.*

IMPLEMENTED IN THE WORKSPACE

- Wallet-based merchant identity & payout settings
- Native NEAR and allowlisted token payment flows
- Payment links, checkout and merchant dashboard
- Verified-settlement receipt UI and PDF downloads
- Rust API, router, reconciliation and webhook code
- Product guide and TypeScript integration examples

BEFORE A BROAD LIVE ROLLOUT

- Validate complete wallet-to-payout journeys
- Review contracts, signing and recovery behavior
- Verify infrastructure and operator monitoring
- Run merchant pilots and measure friction
- Complete mainnet configuration and readiness
- Establish support and reconciliation operations

Build-stage product. This deck makes no claim of audited security, production-scale volume, paying customers or completed fundraising.

SEQUENCING, NOT DATE PROMISES

Prove the flow. Then scale the *tools.*

PHASE 01

Pilot & harden

Validate checkout end to end. Improve reconciliation, monitoring and merchant support from real pilot feedback.

PHASE 02

Package for builders

Publish an SDK, finish authenticated server integration and make checkout easier to embed.

PHASE 03

Merchant operations & channels

Expand merchant tools, a mobile app, Shopify checkout and walletless card/bank payments. Scope and dependencies follow.

Progression should follow observed merchant needs and verified payment reliability.

PLANNED INTEGRATIONS / ESTIMATES & DEPENDENCIES

Meet buyers where they already *shop.*

CHANNEL 01 / PLANNED

Shopify checkout payment app

NEAR appears as a payment method inside Shopify checkout.

4–8+ weeks

Engineering estimate, plus Shopify partner access, review and approval time.

CHANNEL 02 / PLANNED

Walletless card/bank checkout

The buyer pays with fiat and never connects a NEAR wallet.

Several more weeks

Depends on the payment provider, custody and settlement model, and required approvals.

Planning estimates, not committed launch dates. Shopify partner access, review and approval add external lead time. Walletless timing depends on the selected provider and operating model.

PLANNED MOBILE PRODUCT / IOS & ANDROID

Your workspace. In your *pocket.*

A proposed merchant app for managing payments on the go.

CREATE & SHARE

Payment links

Create item or service requests and share payment links directly from a merchant's phone.

TRACK & RECONCILE

Payments & receipts

Check payment status and history, review settlement and access customer receipts.

STAY INFORMED

Notifications & wallet access

Receive payment notifications and connect a compatible NEAR wallet for merchant access.

Scope and timeline: to be defined after mobile product discovery.

Planned iOS and Android app. Discovery covers NEAR wallet connectivity, notification delivery, release requirements and parity with the current merchant platform.

PILOT METRICS / NOT REPORTED TRACTION

Measure settled value. Not wallet *clicks.*

ACTIVATION

First settled payment

From workspace creation to a verified merchant payout.

CONVERSION

Request → settlement

Where customers leave the checkout journey.

RETENTION

Repeat merchant use

Whether the next sale returns to the platform.

RELIABILITY

Settlement verification time

From submission to verified payout completion.

RECOVERY

Orders needing intervention

Pending, retryable and partial payout resolution.

VALUE

Settled volume by asset

Actual payment activity, with token units kept separate.

SEEKING DESIGN MERCHANTS & ECOSYSTEM PARTNERS

Build the next merchant *payment.*

Help validate a wallet-owned payment experience for sellers, studios and online businesses.

01 Pilot a real merchant workflow

02 Validate checkout, payouts and receipts

03 Shape the next developer tools

worldzPayments

Get paid. Keep your *keys.*
